

ABSTRACT

A means for creating perpetual motion of a battery operated fan module has been disclosed. A battery-operated device such as a fan can be operated continuously without interruption for an indefinite period.

This can be accomplished by recycling wasted or unused energy within the device, in such a manner, as to continuously reuse the same energy source eliminating the need for any external energy to keep the said device in operation.

NEW ABSTRACT

A battery operated fan can have its batteries re-charged as the fan is operated, by recycling the wasted energy and re-using it over and over. This can be accomplished by adding a charging component, and using the drive motor to operate the charging device. A voltage regulator is also added to prevent over-charging the batteries. The Fan can then be operated indefinitely without interruption.
